### Cal ISO Flex Alert, Southern California

The California Independent System Operator (ISO) is declaring a Flex Alert for Southern California, from 1000 hours. to 2100 Monday, 06/20/16, due to high temperatures. During times of high temperatures, demand on the power grid can be strained, as air conditioner use increases.

- Please see attached document for full announcement

### Phase II Activation of the Heat Contingency Plan

Phase II of the Heat Contingency Plan will be activated from Sunday, 06/19/16 – Tuesday, 06/21/16. Due to forecasts of dangerous and excessive heat.

- Per the National Weather Service (NWS):
  - Dangerous Heat expected Sunday through Tuesday over much of Southern CA (coastal areas and exception).
  - Sundowner winds expected Saturday afternoon/evening will keep lows into Sunday morning with little relief.
  - A weak offshore flow over far southern CA could break numerous high temperature records Sunday and even more on Monday.
  - Warmest temperatures will be Monday with highs 15-20 degrees above normal for this time of year.
  - Temperatures Monday could be the hottest recorded in a decade.
  - Heat of this magnitude will have impacts for even the general population if precautions are not taken.
  - [See attached NWS Heat Briefing on the heat event.](#)
- State's Top Emergency Manager, Public Health Officer Urge Californians to Prepare for Excessive Heat Beginning this Weekend
  - In response to forecasts of excessive heat early next week, especially in Southern California, state officials are urging Californians to prepare for potentially record-breaking temperatures starting Sunday. State agencies and utility companies have already implemented plans and taken steps in anticipation of the heatwave. (See link for entire Press Release)

# **WEATHER SYNOPSIS BY REGION**

## **NORTHERN CALIFORNIA**

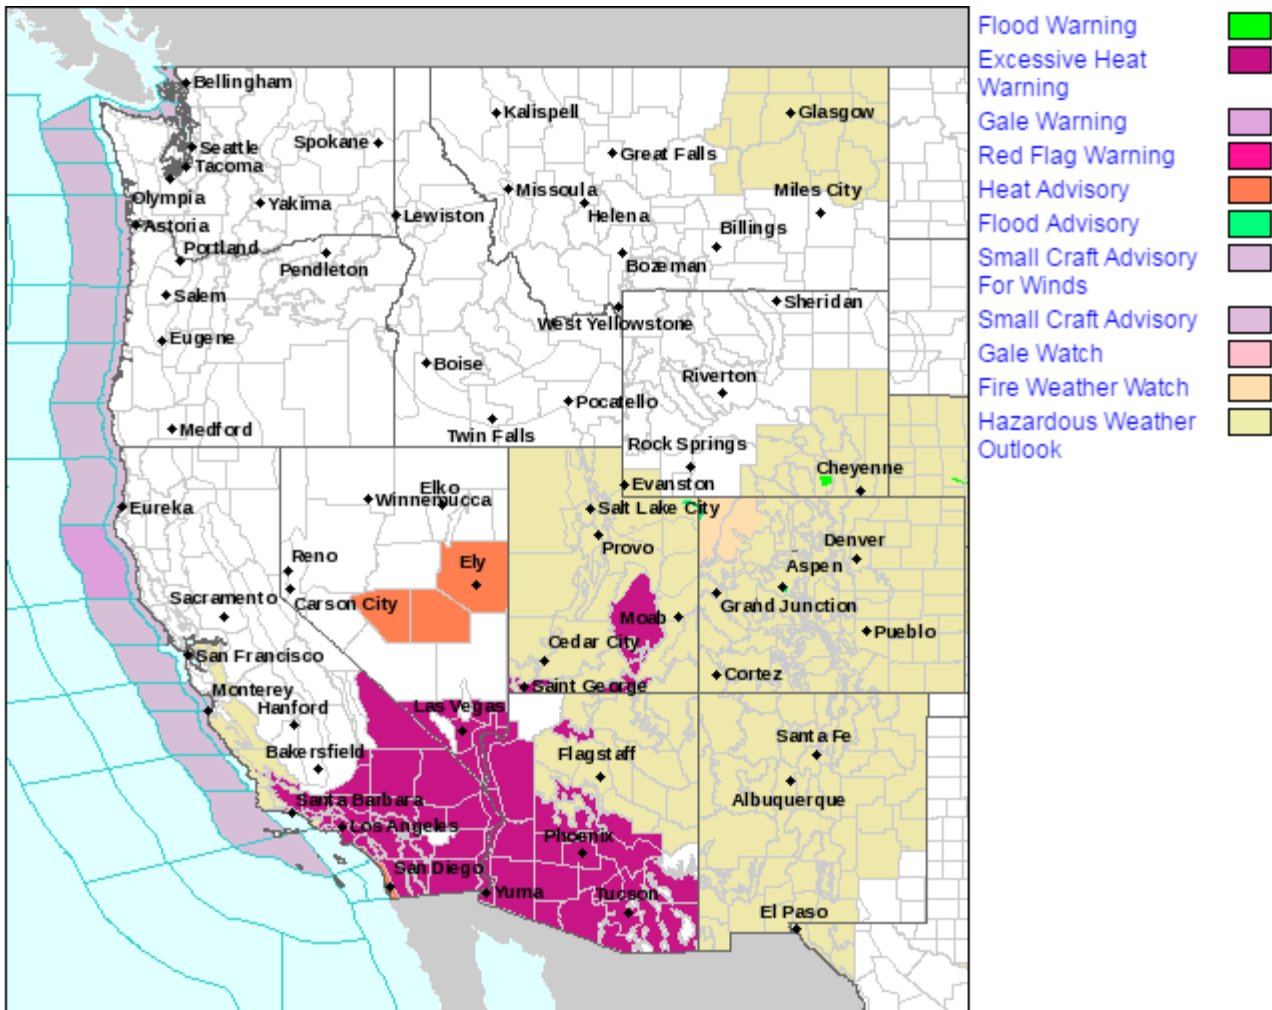

Northern California remains situated between low pressure from the Pacific northwest southwestward over the Eastern Pacific and strong high pressure over the Desert southwest. This pattern puts the region under a mostly dry southwest flow aloft. Computer models are still somewhat inconsistent with the subtle details that will have a significant effect on the region. Previous model runs have shown Northern California more affected by the low pressure than the high, with only a moderate heat wave and a chance for showers or thunderstorms midweek. Computer models are now showing the high pressure ridge as the main influence on Northern California weather, with hot and dry weather continuing through midweek and only a very slight chance of showers in far northern areas late in the week or next weekend. This pattern will lead to temperatures reaching 8-12 degrees above normal and minimum afternoon RH of 8-16% in the warmest inland areas through Thursday. Occasional north to northeast surface winds will enhance the hot and dry conditions from the western Sierra slopes to the coast during this time, and poor overnight RH recovery, to only 25-35%, will be common. Late in the week the disturbance mentioned above may bring slightly cooler temperatures and a chance of showers or thunderstorms to the far northern mountains.

## **SOUTHERN CALIFORNIA**

Northwest pressure gradients will bring nightly northerly winds of 15 to 25 mph with gusts to 40 mph to the South Coast of Santa Barbara through Monday. Pressure gradients will become west Tuesday and Wednesday causing the winds across the South Coast of Santa Barbara to become northwest and more localized. These northwest winds will become northerly once again Thursday through next weekend, with winds of 20 to 30 mph with gusts up to 50 mph. The only other windy locations across the region will be across the desert passes Tuesday and Wednesday afternoons, with westerly sustained winds of 15 to 25 mph. Strong high pressure centered over the Desert Southwest will bring hot and very dry conditions to most of the area through next weekend. However, a stronger onshore breeze will bring significant cooling to the coastal areas starting Tuesday. Maximum temperatures will be in the mid 80s to mid 90s across the mountains and upper 90s to 110 in the valleys today. Widespread minimum humidity in the single digits and teens along with poor nighttime humidity recovery will occur away from the coastal areas through next weekend. Isolated thunderstorms over the mountains and deserts for Wednesday and Thursday no longer look likely as the latest computer models keep the flow aloft out of the southwest.
